

HECTOR CABRA

Sydney, NSW · 0466 799 234 · hectorcabra95@gmail.com · linkedin.com/in/hectorcabra · github.com/Autokratz

PROFESSIONAL SUMMARY

IT professional with five years of combined industry experience across software development, project delivery and data analysis, including a year in Sydney leading a team of ten developers to build an enterprise CRM and customer ticketing platform. Bachelor of Software Engineering, completing an Advanced Diploma of Networking Engineering in October 2026. Having designed and built a ticketing system end to end, understands service desk workflow — lifecycle, queue, priority and escalation — from the inside rather than from a manual. Strong Linux, Windows and network fault diagnosis, and calm with stakeholders when things are not going to plan. Studying ITIL 4 Foundation and CCNA.

TECHNICAL SKILLS

Service desk & support — Ticket lifecycle, queue and priority workflow design, escalation and handover, SLA concepts, end-user communication, incident documentation, Windows 10/11 support, Microsoft 365, account and password administration, hardware and peripheral diagnostics, remote support (ITIL 4 Foundation in progress)

Networking — TCP/IP, DNS, DHCP, subnetting, OSI model, routing and switching concepts, VPN, QoS and traffic shaping, firewall policy, troubleshooting with ping, traceroute, iperf3 and tcpdump

Operating systems — Windows 10/11, Linux (Ubuntu, Debian), command-line administration, systemd, boot and driver troubleshooting

Programming & scripting — JavaScript, TypeScript, C#, Python, SQL, Bash, HTML5, CSS3

Data & reporting — SQL, Power BI, Excel (advanced), dashboard design, reporting automation

Tools & practice — Git, GitHub Actions (CI), pytest, mypy, ruff, Jira, Trello, React, Node.js, Express, MongoDB, REST APIs, Agile iteration planning

PROFESSIONAL EXPERIENCE

Software Developer, promoted to Project Manager — Kangaroo IT

Auburn, NSW · September 2023 – September 2024 · Software development traineeship

- **Promoted from trainee software developer to project manager** during the program, taking ownership of delivery while continuing to write code alongside the team
- **Designed and built a customer ticketing system end to end** — ticket submission, queue handling, status and priority workflow, and resolution tracking — giving direct working knowledge of how service desk platforms operate beneath the interface
- **Led a team of ten developers** delivering the company's internal enterprise platform, replacing a legacy system that provided almost no working functionality at the time I joined
- Built the CRM module covering customer records, account management and service history
- Developed the web application in **JavaScript and TypeScript**, and a companion desktop client in **C#**
- Owned iteration planning, delivery tracking and progress reporting using **Jira and Trello**, presenting directly to the **CEO and executive team** — including leading the difficult conversations when iterations slipped against expectations and re-planning scope to recover
- **Delivered a deployed, working prototype** of the full platform — CRM and customer ticketing — taking the company from an outdated system to a functioning product within twelve months

Data Analyst — Zcial

Colombia · 2016 – 2020 · Hybrid

- Analysed revenue and profitability for a **live events business** operating across concerts and professional football matches, using **SQL, Power BI and Excel**
- Delivered reporting and analytics on an in-house platform built by the team, covering real-time ticket purchasing and peer-to-peer resale through a customer mobile application
- **Owned QR code issuance and validation across live events**, including on-site operational support — resolving access control and scanning failures in real time, in front of crowds, with no option to defer the problem
- Worked on an early adopter of QR-based ticketing in the Colombian market, where event logistics technology was significantly less mature than in Australia or the US

TECHNICAL PROJECTS

Linux Boot and Display Driver Fault Resolution — 2026

- Diagnosed a boot-time race between the simple framebuffer driver and the NVIDIA kernel mode-setting driver that was crashing the display manager on Ubuntu 26.04
- Worked the fault by layer from the console — isolated it to early boot, ruled out user-space and configuration causes, and confirmed driver load order as root cause
- Identified that the distribution had migrated from initramfs-tools to **dracut**, invalidating every published fix, and resolved it through dracut configuration — then documented it, as no current guidance existed

Enterprise Network Performance Lab — QoS, LACP and Site-to-Site VPN — 2026

github.com/Autokratz/network-qos-lab

Designed, built and remediated two routed enterprise topologies — a head-office campus LAN and a remote branch over a site-to-site VPN — in Linux network namespaces, with every result measured rather than simulated.

- Reduced voice round-trip time from **152 ms to 20 ms (-87%)** and jitter from **1.29 ms to 0.002 ms** on a congested 10 Mbps uplink by replacing deep tail-drop queuing with HTB class-based shaping and u32 filters matching DSCP EF
- Eliminated **0.072% voice packet loss to zero** while the uplink remained at approximately 99% utilisation — protecting real-time traffic without reducing total throughput
- Recovered a branch WAN link from **100.1% to 5.2% output utilisation** and cut branch RTT from **713 ms to 30 ms (-96%)**, removing **3.33% packet loss**, through time-based bandwidth policy
- Aggregated dual uplinks using **802.3ad LACP bonding**, secured branch traffic over a **WireGuard site-to-site tunnel** with nftables policy, and documented a full Linux-to-vendor equivalence map so the configuration transfers directly to Cisco environments

netwatch — Network Monitoring Tool (Python package) — 2026

github.com/Autokratz/netwatch

- Built and published a dependency-free Python package that probes network targets over ICMP and TCP, evaluates latency and packet-loss thresholds over a rolling window, and exits non-zero when a target is breaching — usable as a post-change gate in CI, not only as a dashboard
- Implemented **alerting hysteresis** so a breach must persist across consecutive checks before firing and recovery before clearing, preventing the alert flapping that causes teams to mute monitoring channels
- Wrote **128 tests at 96% branch coverage**, passing mypy --strict and ruff, with **GitHub Actions CI** running lint, type checking and the suite across Python 3.11, 3.12 and 3.13, and recorded the design trade-offs as architecture decision records

NEURON — Browser-Based Coding Education Platform — 2026

github.com/Autokratz/neuron

- Shipped a zero-backend learning platform delivering **43 graded coding quests**, executing real **Python via Pyodide (WebAssembly)** client-side and grading against hidden assert-based test suites

EDUCATION

Advanced Diploma of Networking Engineering — Abbey College Australia, Sydney · *completing October 2026*

Enterprise network design, QoS and traffic engineering, routing and switching, WAN technologies, network security

Diploma of Information Technology — Wells International College, Australia · *2024*

Bachelor of Software Engineering — Politécnico Grancolombiano, Colombia · *2024*

Four-year degree. Software engineering, algorithms and data structures, databases and object-oriented programming, delivered primarily in Python.

Full Stack Web Development Bootcamp — Nucamp · *2023*

HTML, CSS, JavaScript, React, React Native, Node.js, Express, MongoDB

CERTIFICATIONS & PROFESSIONAL DEVELOPMENT

- **ITIL 4 Foundation** — currently studying
- **Cisco CCNA** — currently studying
